

Water is precious to the World
Maxine Solis

While we were exploring the different kinds of agriculture in our BC2BC workshop, one of the most important concepts that captivated my attention was water. Most of my pictures made me realize how atrocious the world/our environment is with our water system. In one of our historical landmark parks that we encountered had a tainted water system. Instead of us appreciating our outdoors it had showed us we have slowly progressed to destroy it.

Negligence has caused many of our waters to become polluted. Rather than having nice, clean, refreshing water we have managed to come up with nasty, impure, sewage water. As you can see in our photos the water seems to have a green tint to it instead of the crystal like water you would be pleasant to see.

Water is universal; it is known that human beings are made up of approximately 60% of water. Water is used for drinking, cleansing, purifying (religion), in products from nail polish removal to lemonade, and is essential for human beings and animals survival. In certain places around the world many animals are becoming harmed by the toxins in oceans, stream, rivers, and bayous especially penguins, fish, crabs, lobsters, and whales.

The world is made up of 70% percent of water and 1% of it is contaminated. If we continue to dispose of certain chemicals we will continue to harm the ecosystem. What will become of use if we continue to abuse our precious water? Nobody wants to shower in nasty water!
